

5 Tips to save on your gas

1. Tire Pressure - By properly inflating your tires you can increase your fuel economy. Check your tire sidewall for the proper amount, but it usually 35 PSI. Properly inflated tires can give you a 2 - 5% savings.

2. Change Your Air Filter - Most people don't check this often enough, but a dirty air filter causes less air to enter into your engine. A clean air filter will yield approximately 1 to 3% savings.

3. Driving - This has a big impact on your fuel economy. Don't Jam on the gas every time you get a green light. Drive the speed limit on the freeway and give yourself adequate braking time. Changing your Driving habits can give you a 5 to 10% savings.

4. Open your windows - Using the A/C uses a lot of gas. If its cool outside, roll your window down to save 3 -5%.

5. Install a HFS-1 System - By using the HFS-1 System it produces fuel for your car from water. When mixed with your gasoline you can save an additional 20-60% on your fuel economy.
